

A scatter plot showing the relationship between mean KL (x-axis) and KL variance (y-axis) for various combinations of β and f_0 . The x-axis ranges from 0 to 4.5, and the y-axis ranges from 0.05 to 1.0. Data points are labeled with their corresponding β and f_0 values. The plot shows that for low f_0 values (0.02, 0.05, 0.08), the mean KL is relatively low (around 1.5 to 2.0) and the KL variance is high (around 0.8 to 1.0). As f_0 increases, the mean KL increases significantly, reaching around 4.0 for $f_0 = 0.12$, while the KL variance decreases, reaching around 0.1 for $f_0 = 0.12$. The β values (0.1, 0.2, 0.4, 0.6, 0.8) also influence the mean KL, with higher β values generally leading to higher mean KL for a given f_0 .

A scatter plot showing the relationship between mean relative L2 (x-axis) and mean prediction agreement (y-axis) for various models. The x-axis ranges from 0.0 to 4.0, and the y-axis ranges from 0.3 to 1.0. Data points are labeled with model names and their corresponding L2 values. The plot shows a general trend where higher L2 values correspond to lower prediction agreement, with some outliers.

Model	mean rel L2	mean pred_agree
b1.0	0.3	0.98
f0.01	0.3	0.97
b0.01	0.3	0.96
f0.02	0.3	0.95
